M M M -j \frac{2\pi}{M} (ux + vy)

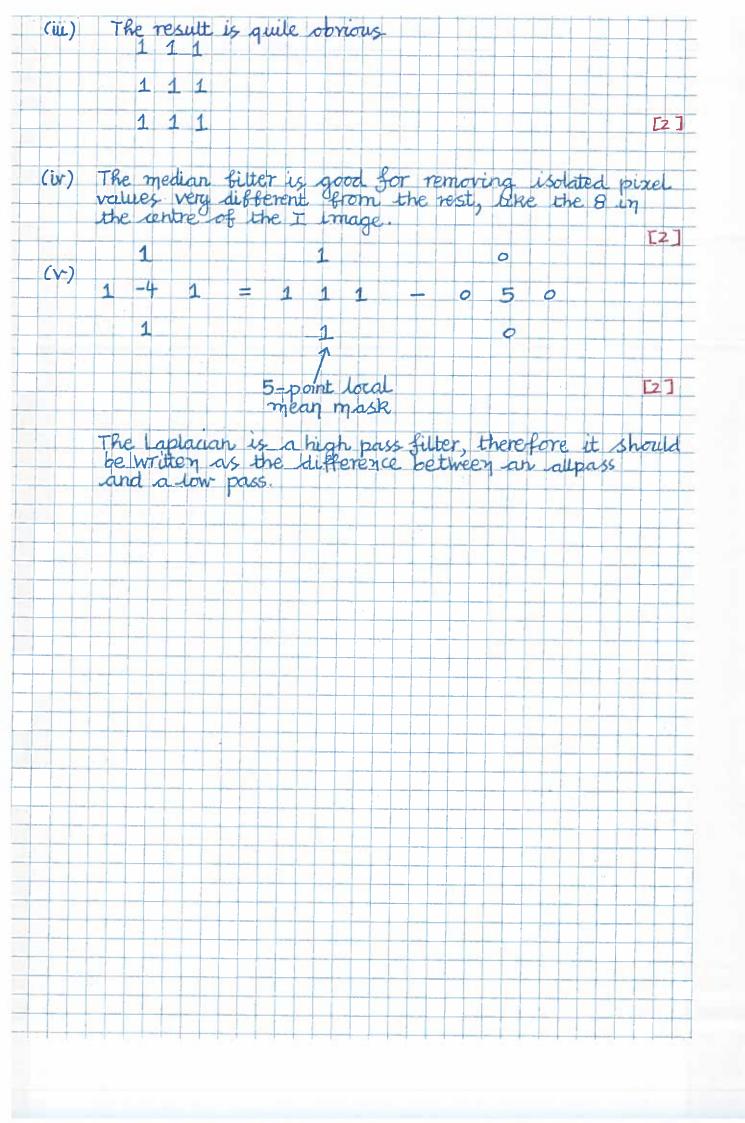

(i) F(u, v) = \frac{1}{(2M+1)^2} - M - M
                                                                                                                                                                                                                                                                                                                                                                                               (1)
                                  F(-u, -v) = \frac{1}{(2M+1)^2} \frac{M}{-M} \frac{M}{-M} \frac{M}{-M} \frac{j\frac{2h}{M}(ux+vy)}{(ux+vy)} = F^*(u,v)
                                     if f(x,y) = real.
           (ii) F(u, v) = \frac{1}{(2M+1)^2} \frac{-M-M}{M} \frac{j}{M} \frac{2\pi}{M} \frac{(ux+vy)}{M} \frac{j}{M} \frac{2\pi}{M} \frac{j}{M} \frac{2\pi}{M} \frac{j}{M} \frac{j}{M}
                                                                                                                                                                                                                                                                                                                                                                                         (2)
                                            If f(x,y) is symmetric, (2) becomes
                                            F(u,v) = \frac{1}{(2M+1)^2} \sum_{-H-H}^{H-H} \int_{-H}^{H} (ux+vy)
                                                                                                                                                                                                                                                                                                                                                                                           (3)
                                   From (1) we write
F(u,v) = \frac{1}{(2M+1)^2} - \frac{\sum \sum f(x,y)}{m} \cos\left[\frac{2\pi}{M}(ux+vy)\right]
                                                                               -\frac{1}{J} = \sum_{n=1}^{M-M} \sum_{m=1}^{M-M} f(x,y) \sin \left[\frac{2\pi}{M} (ux + vy)\right] = A - \frac{1}{J}B (4)
                                          From (3) we write
                                      F(u,v) = A + jB (5)
                                        From (4), (5) we see that B = Im \{F(u,v)\} = 0
                                                                                                                                                                                                                                                                                                                                                                                                                      2]
             (iii) If f(x,y) is antisymmetric, (2) becomes
F(u,v) = \frac{-1}{(2M+1)^2} \sum_{-M} \frac{\sum_{-M} f(x,y)e^{\frac{1}{M}} (ux+vy)}{\sum_{-M} f(x,y)e^{\frac{1}{M}} (ux+vy)}
                                                                                 = - A - jB
                                        From (4), (6) we see that A = Re 1 F(4,v) } =0
